Welcome to Multilingual RAG

Welcome to Multilingual RAG

This PDF is created for testing the PDF Loader in the Multilingual RAG project.

The loader should extract text correctly from each page.

Each page should have its own metadata such as page number, file type, language, and text length.

This project uses FastAPI, FAISS, Semantic Chunking, OCR, and Language Detection.

The purpose of this document is only to verify that the PDF Loader works correctly.

Semantic Chunking divides text into meaningful ch…

Semantic Chunking divides text into meaningful chunks before creating embeddings.

FAISS is used to store embeddings and perform similarity search efficiently.

The ingestion pipeline extracts text, detects language, creates chunks, and stores them in the vector database.

This page is included to verify that the PDF Loader correctly processes multiple pages.

The test should return two page objects with the correct metadata.
